Income Inequality Information

Gini Coefficient* of Income Inequality

*The Gini coefficient was developed to measure the degree of inequality of a variable in a distribution of its elements. The Gini coefficient ranges between 0, where there is perfect equality, and 1 where there is perfect inequality.

Obesity and Diabetes Among Adults and Children in Kansas and USA

- Concurrent increasing trends of obesity and diabetes in adults are observed in Kansas. Increasing prevalence rates of obesity have been observed among US children and adolescents in the last four decades.
- A clinic-based study among obese children (4-10 years) and adolescents (11-18 years) showed that the prevalence of impaired fasting glucose was 25% and 21%, respectively. Type 2 diabetes was also diagnosed among 4% of the adolescents.

Obesity Definition: adults: BMI ≥ 30.0; children: BMI ≥ 95th percentile. Diabetes Definition: Fasting glucose ≥ 126 mg/dL. Source: 1992-2003 Behavioral Risk Factor Surveillance System, Office of Health Promotion, Kansas Department of Health and Environment

Age-Adjusted Cancer Death Rates By Site Among Female Residents in Kansas (1998-2002)

Rates are per 100,000 Female Population and age-adjusted to the 2000 U.S. Standard Population. Data Source: Kansas Vital Statistics database, Center for Health and Environmental Statistics, Kansas Department of Health & Environment.

- In 2002, age-adjusted cancer death rate (all sites) among females in Kansas was 160.5/100,000 population, lower than that of the US 163.1/100,000 population.¹
- Lung cancer is the leading cause of death among females as well as males Kansans.²

Age-Adjusted Cancer Death Rates by Site Among Male Residents in Kansas (1998-2002)

Rates are per 100,000 Male Population and age-adjusted to the 2000 U.S. Standard Population. Data Source: Kansas Vital Statistics database, Center for Health and Environmental Statistics, Kansas Department of Health & Environment.

- In 2002, age-adjusted cancer death rate (all sites) among males in Kansas was 231.8 per 100,000 population, higher than that of female counterparts but lower than that of the United States male residents (238.9 per 100,000).¹
- Colon cancer is the third leading cause of death in men as well as in women in Kansas. The same trend is observed in the United States.²

Age-Adjusted Invasive Cancer Incidence Rates By Primary Site Among Female Residents in Kansas (1997-2002)

Rates are per 100,000 Female Population and age-adjusted to the 2000 U.S. Standard Population. Data Source: Kansas Cancer Registry

- Invasive cancer age-adjusted incidence rate (all sites) among females in Kansas was essentially stable during 1997 to 2002 (424/100,000 in 2001).¹ This incidence rate was higher than that of females in the United States (405/100,000 in 2001).²
- Among female Kansans, breast cancer was the most frequently diagnosed cancer (126.4/100,000 in 2002), but represented the second leading cause of death.¹

Tobacco Use in Kansas – Key Indicators

- Youth rates have declined in the recent past, leveling out at approximately the adult prevalence rate. Youth rates are used to measure youth access and initiation.
- Adult quit attempts in the past 12 months by adult Kansas smokers have remained consistently in the 40-50% range since 2000. Cessation attempts are used to gauge community norm changes as well as short/intermediate term outcome objectives.
